

Christian
Kusumadjaja.

The Empathetic Systems-Thinker.

COMPUTER SCIENCE & DATABASE
TECHNOLOGY.

BRIDGING DATA ARCHITECTURE WITH
HUMAN-CENTRIC DESIGN.

Interest & Motivation.

"I believe that brilliant architecture is invisible; you only notice the impact it creates."

As a Computer Science student specializing in Database Technology, I am captivated by what happens behind the scenes. My passion lies in turning chaotic, fragmented data into structured, scalable solutions through robust data engineering, ETL pipelines, and backend architecture.

I thrive on solving structural puzzles to build the quiet engines that drive informed decision-making. Ultimately, I engineer with empathy—bridging complex technical architecture with human-centric design to ensure the systems I build truly empower the people who rely on them.

My Journey

From Zero to Belonging

Entering Computer Science with zero background was intimidating, but I turned that fear into a relentless drive to learn. Guided by peers and mentors, I expanded my knowledge from basic C to complex computational logic, gradually turning an unfamiliar world into a place where I belong.

Now progressing with a 3.92 GPA, my focus is locked on Database Technology. I dig deep into Big Data architectures, Python processing, and Pentaho pipelines to solve real business puzzles, while refining my Agile collaboration skills and sharpening my logic through competitive SQL challenges.

Growing Through Community

Beyond the screen, I serve as the Territorial Division Lead at my Parish Youth Ministry, uniting communities across 10 regions and 45 neighborhoods. For a natural introvert, this constant need for diplomacy was initially daunting.

Yet, a realization that "faith is meant to be shared" shifted my perspective. By connecting over 350 youths through a unified system, I built a support network that empowered local leaders. It taught me a profound lesson no CS syllabus could: how to drive collective action and lead purely through trust and empathetic service.

Where Both Worlds Meet

Ultimately, my technical and social worlds collided. Seeing my parish struggle with scattered spreadsheets, I engineered a digital directory to manage data across 45 neighborhoods.

I realized then: technical skill without empathy creates systems nobody uses, while leadership without tools doesn't scale. The intersection of both is exactly where I build.

1. Church Directory Web Platform

REAL-WORLD SOLUTION / FULL-STACK

A self-driven, full-stack web directory designed to solve operational chaos at OMK Paroki Kedoya by centralizing scattered member data and event histories into a unified system.

Impact

Built a centralized system allowing multiple divisions to efficiently track member attendance and assign event roles.

Scheduled for a real-world pilot test to manage Sikep attendance before a full parish-wide deployment.

Learnings

Mastered full-stack development by building a system tailored directly to a community's specific operational needs.

Learned the importance of creating scalable solutions that bridge the gap between technical architecture and human users.

2. PoestaKas Frontend Interface

TEAM COLLABORATION / FRONTEND ENGINEERING

A collaborative web development project where I served as a frontend developer, taking ownership of designing core features while strictly aligning the interface with backend requirements.

Impact

Designed and updated UI components for two main features, ensuring strict visual consistency across the platform.

Assisted in cross-functional feature testing to ensure a seamless integration between the interface and the system logic.

Learnings

Discovered that effective frontend engineering requires a deep understanding of backend concepts to ensure perfect data alignment.

Refined my ability to collaborate, adapt, and maintain code consistency within a structured development team.

https://github.com/Briant-s/project_se_-3 

3. Enterprise Data Integration Pipeline

BACKEND LOGIC / DATA ENGINEERING

Acting as team lead, I engineered an ETL pipeline using Pentaho to prepare a complex snapshot dataset for machine learning applications.

Impact

Navigated dataset limitations by designing dual data models: a functional Pentaho schema and an ideal transactional architecture.

Led the pipeline development to ensure the resulting dataset was fully optimized for predictive model training.

Learnings

Gained a profound understanding of how different dataset types dictate architectural choices in data modeling.

Learned to balance rigid academic requirements with practical data engineering realities when building structural models.

4. Maven Roasters Business Dashboard

BUSINESS INTELLIGENCE / VISUALIZATION

An interactive business dashboard focusing on exploratory and explanatory data analysis to present factual, unbiased visual narratives to stakeholders.

Impact

Structured a cohesive visual layout that conveyed factual, unbiased insights directly to business stakeholders.

Successfully translated complex exploratory data into an explanatory format suitable for executive business presentations.

Learnings

Mastered the art of honest data storytelling, learning that a good visual must present the truth without introducing analytical bias.

Bridged the gap between technical data analysis and strategic business communication.

5. Analytical Prediction Model Evaluation

DATA ANALYTICS / PREDICTIVE MODELING

An analytical project utilizing Python libraries to process data, engineer features, and train predictive models while navigating the challenges of data integrity.

Impact

Conducted thorough feature engineering to significantly increase the accuracy and reliability of the predictive model.

Identified, analyzed, and successfully patched a critical data leakage issue during the model evaluation phase.

Learnings

Deepened my practical knowledge of Python data libraries for both exploratory analysis and predictive modeling.

Learned a hard but valuable lesson on data leakage, realizing that maintaining data integrity is just as crucial as building the model.
